

Assignment - 6

Course: MST501-1: Python
Programming for Statistics

Done by:

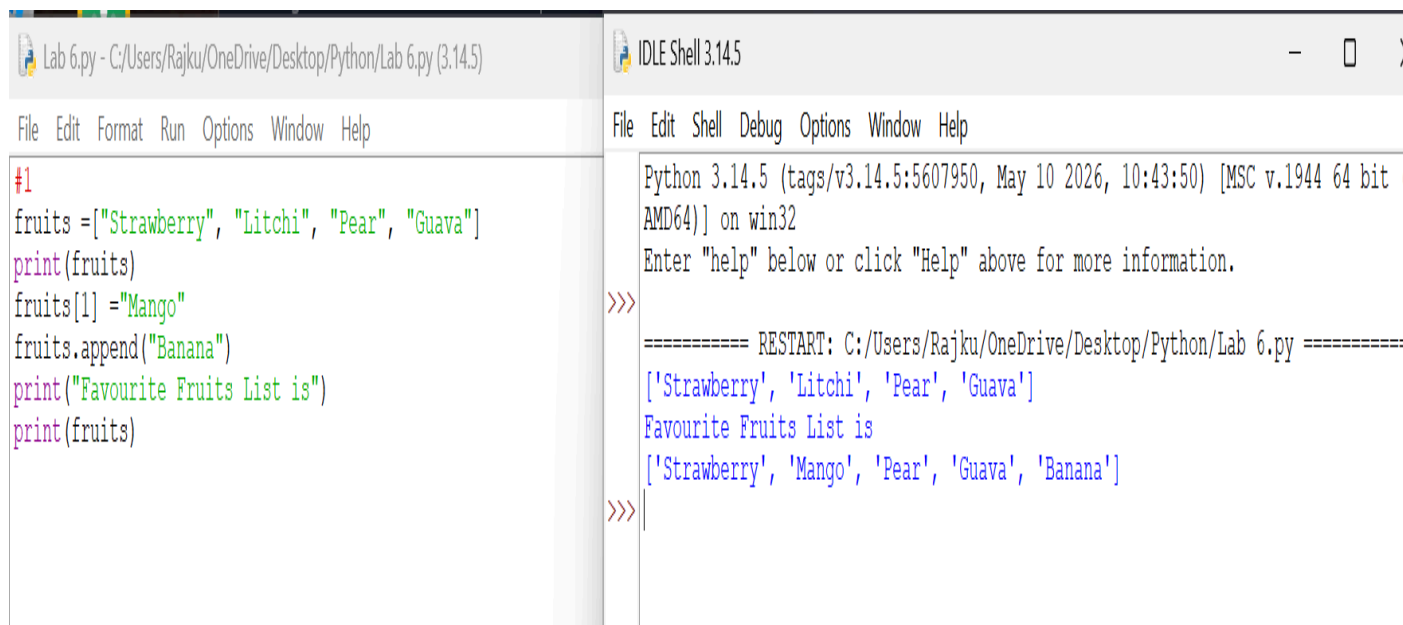

Name: Ankita Das

Register Number: 2648103

Date: 09/07/2026

1. Write a Python program that creates a list containing four of your favourite fruits. Your program should change the second fruit in the list to "Mango", and then add "Banana" to the very end of the list. Finally, display the completed list to the user by printing it out.

```
Ans- fruits=["Strawberry", "Litchi", "Pear", "Guava"]
print(fruits)
fruits[1]="Mango"
fruits.append("Banana")
print("Favourite Fruits List is")
print(fruits)
```

The screenshot shows a Python IDE with two windows. The left window, titled 'Lab 6.py - C:/Users/Rajku/OneDrive/Desktop/Python/Lab 6.py (3.14.5)', contains the following code:

```
#1
fruits=["Strawberry", "Litchi", "Pear", "Guava"]
print(fruits)
fruits[1]="Mango"
fruits.append("Banana")
print("Favourite Fruits List is")
print(fruits)
```

The right window, titled 'IDLE Shell 3.14.5', shows the output of the script after execution:

```
Python 3.14.5 (tags/v3.14.5:5607950, May 10 2026, 10:43:50) [MSC v.1944 64 bit
AMD64] on win32

===== RESTART: C:/Users/Rajku/OneDrive/Desktop/Python/Lab 6.py =====
['Strawberry', 'Litchi', 'Pear', 'Guava']
Favourite Fruits List is
['Strawberry', 'Mango', 'Pear', 'Guava', 'Banana']
>>>
```

2. Write a Python program that creates a tuple to store three pieces of information about a student: their name, their age, and their favourite colour. Your program must unpack this tuple into three separate variables named name, age, and colour. Once the tuple is unpacked, print each variable on its own new line

```
Ans-student = ("Alice", 14, "Blue")
name, age, colour = student
print("Name is", name)
print("Age is", age)
print("Favourite colour is", colour)
```

```
Lab 6.py - C:/Users/Rajku/OneDrive/Desktop/Python/Lab 6.py (3.14.5)
File Edit Format Run Options Window Help

#2
student = ("Alice", 14, "Blue")
name, age, colour = student
print("Name is", name)
print("Age is", age)
print("Favourite colour is", colour)

Name is Alice
Age is 14
Favourite colour is Blue
>>>
```

along with a friendly, descriptive message, such as "Age is 14".

3. A student has a tuple that contains their recent test scores, which are given as scores = (85, 92, 78, 92, 89). Write a Python program that first finds and prints out exactly how many times the score 92 appears in this tuple. After that, your program should convert the scores tuple into a list so you can modify the data, remove the lowest score of 78 from the list, convert the list back into a tuple, and print the final tuple.

Ans- scores= (85, 92, 78, 92, 89)
count= scores.count(92)
print("92 appears", count, "times")
scorel= list(scores)
scorel.remove(78)
scores= tuple(scorel)
print("Final tuple is", scores)

```
Lab 6.py - C:\Users\Rajku\OneDrive\Desktop\Python\Lab 6.py (3.14.5)
File Edit Format Run Options Window Help

#3
scores= (85, 92, 78, 92, 89)
count= scores.count(92)
print("92 appears", count, "times")
scorel= list(scores)
scorel.remove(78)
scores= tuple(scorel)
print("Final tuple is", scores)
